

Grazing Management CSP Enhancement

Conservation Practice Job Sheet

- ☐ Improve livestock distribution through rotation of salt, mineral, and supplemental feeding areas and paddock areas. (Includes rotation of hay, rolling round bales).

This practice is based on the management of feed supplement areas so that locations of livestock concentration areas are rotated weekly during the grazing season in a manner promoting improved distribution of nutrients from manure and feed refusal, resulting in reduced nutrient concentrations. A different location should be used when livestock are rotated back into a paddock. Supplements and harvested forage feed areas should be located away from watering points, or in strategic locations that otherwise encourage better livestock distribution.

Documentation Required: Use the following table for documentation and attach a plan map showing the previous and new locations of salt, mineral, and supplemental feeding areas.
